Practical-9

Secure User Registration with Database Insert, Duplicate Email Check, and Password Hashing

Theory :

1. **Is password_hash() used before storing passwords?**

   Ans: Yes. password_hash() is used to securely hash passwords before storing them in the database.

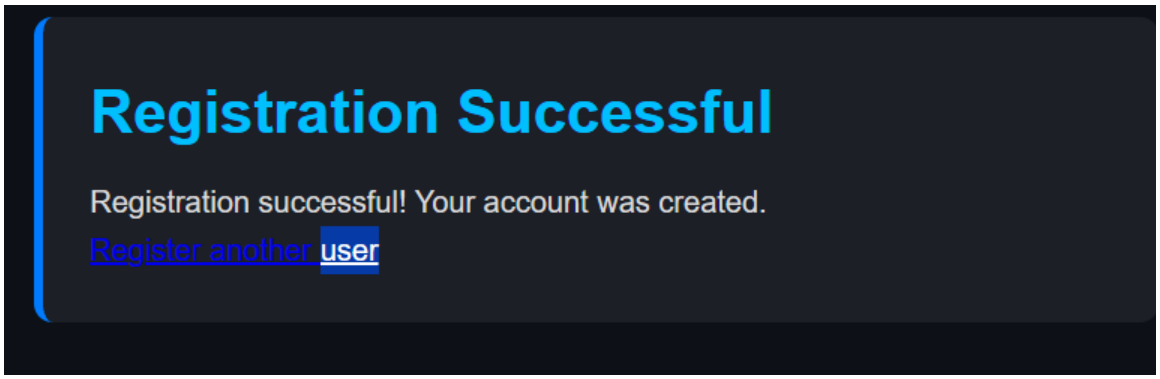

2. **Is duplicate email/username checked?**

   Ans: Yes. Duplicate email addresses and usernames are checked to prevent multiple accounts with the same credentials.

3. **Are frontend and backend validations consistent?**
   Ans: Yes. Frontend and backend validations are consistent. Both validate user inputs, while backend validation provides additional security.

Result:

student_id	name	email	hash_prefix
3	test	test@gmail.com	$2y$12$UtB
2	Mira Sample	mira.sample@example.test	DEMO_ONLY_
1	Aarav Demo	aarav.demo@example.test	DEMO_ONLY_

A. GitHub Repository Link:

GitHub Repository: https://github.com/rehansaiyed72/student-hub-portal

B. Challenges Faced: During implementation, I faced challenges in validating user inputs on both the frontend and backend.I faced difficulty checking duplicate email addresses and usernames before inserting data into the database. I also faced challenges in implementing password hashing and handling database errors secure

C. Learning Outcome:- I learned how to implement secure user registration using PHP and MySQLi. I understood how to validate user inputs and check duplicate email addresses and usernames. I also learned how to hash passwords securely using password_hash() before storing them in the database.
